

Communication & key flow

OPTIONAL · OFF-NETWORK PATH VIA DMZ FORWARDER

For endpoints that can't reach the dashboard directly. The forwarder relays the exact signed, encrypted bytes and never decrypts them.

Charter-rooted trust: BigFix (:52311) delivers the agent binary and the signed charter. The charter carries the trust anchor (the Strongbox anchor public key + fingerprint), the ingest URL, and the enroll key; the agent verifies the charter signature and stores the anchor.

Every dashboard call is HTTPS to nginx :31313 → FastAPI 127.0.0.1:5001; the agent verifies the dashboard's TLS certificate by default (verify_ssl on, Root CA in the agent package); trust also rests on the stored anchor and signed, encrypted payloads. Signed calls bind timestamp + method + path + SHA-256(body); private keys never leave the endpoint.

Each response carries instructions: heartbeat acks set the next-run interval, criticality, and watchdog poll cadence; /me returns policy and re-verified keys.
